Hufcor Introduces New Pocket Doors for Use With Operable Partitions

We are pleased to announce the availability of a new style pocket door. The new pocket door is constructed the same as the 630 panel – same frame, with or without vertical trim and the same 3 trim color choices.

The new pocket door is a result of many ideas and suggestions received from experienced installers and salespeople. The design is durable and easier to install due to more built-in adjustability.

New Pocket Door Highlights and Features:

1. Doors have a 2" bottom clearance to match the 63X series panels. More clearance accommodates uneven floors.
2. New D-ring handle with smaller diameter. Permits placement on the strike side without interference when a Lever Closure panels seal against it.
3. Positive latch top & bottom in the pocket door rail for greater stability.
4. Deadlock locks the handle assembly and is located in the vertical. No need for floor lock plate. No longer located in the bottom rail.
5. Trimmed or untrimmed product built on same platform as basic panels. Allows for HPL, veneer, etc. as options. (Not all substrates are available in all STCs nor as trimmed or untrimmed.)
6. New option for a bulbseal on strike side instead of jamb when there is a tight condition.
